BD PosiFlush™ SureScrub™ Saline and Heparin Lock Flush Syringes
Usage Guidelines

Do not place on a sterile field.

BEFORE USE

1. Tear open package at either end and remove syringe and alcohol pad.
2. Depress plunger with tip cap on to relieve the resistance between the stopper and the barrel.

Using the sterile alcohol prep pad provided, disinfect needleless connector per your institution’s policy and device manufacturer’s recommendations. Scrubbing for at least 5 seconds followed by 5 seconds drying is recommended.

Using aseptic technique, remove the syringe tip cap from the FLUSH syringe by twisting it off.

Hold the syringe upright and expel the air and any excess solution in the syringe by positioning the front rib of the gray plunger tip at desired solution volume.

AFTER USE

Discard used alcohol prep pad, the used syringe and any unused portion of the solution according to your institution’s policy. DO NOT REUSE.

Note: 3, 5 and 10 mL BD PosiFlush™ Syringes all have the same diameter as a standard 10 mL syringe and may be used for flushing catheters when protocols stipulate use of a 10 mL syringe to minimize flush pressure (PSI).

Please read labeling at all times.
