IV medication safety from the pharmacy to the bedside

Pharmacists can do everything right, but errors can occur at the point of infusion. Nurses can do everything right, but errors can happen during IV compounding in the pharmacy. An estimated 56% of medication errors are IV-related, and 61% of these errors are life-threatening.1 One in 10 complex IVs is compounded inaccurately.2

**ONE ERROR is all it takes to cause a potential fatal patient event.**
