Safe-T-Centesis® catheter drainage system

Innovations in patient safety, clinician safety and procedural efficacy.
Safe-T-Centesis® catheter drainage system

This innovative drainage system is designed to reduce the risks associated with normal percutaneous needle placements and enhance patient comfort and procedural flexibility.

- **Self-sealing valve**: Maintains closed system or allows for reinsertion of introducer needle or guide wire for procedures not requiring maintenance of a closed system.
- **Remote stopcock**: Provides procedural convenience and safety by facilitating connection to drainage/extension sets while minimizing inadvertent device or catheter movement.
- **Catheter modularity**: For procedures not requiring maintenance of a closed system, the luer lock connection allows convenient removal of pigtail catheter from valve assembly.
- **Self-sealing valve**: Maintains closed system or allows for reinsertion of introducer needle or guide wire for procedures not requiring maintenance of a closed system.
- **Remote stopcock**: Provides procedural convenience and safety by facilitating connection to drainage/extension sets while minimizing inadvertent device or catheter movement.
- **Self-sealing valve**: Maintains closed system or allows for reinsertion of introducer needle or guide wire for procedures not requiring maintenance of a closed system.
- **Remote stopcock**: Provides procedural convenience and safety by facilitating connection to drainage/extension sets while minimizing inadvertent device or catheter movement.
- **Self-sealing valve**: Maintains closed system or allows for reinsertion of introducer needle or guide wire for procedures not requiring maintenance of a closed system.
- **Remote stopcock**: Provides procedural convenience and safety by facilitating connection to drainage/extension sets while minimizing inadvertent device or catheter movement.
Innovations for patient safety and procedural efficacy

Our combination of unique features provides patient protection from perforations and clinician protection from needlestick injuries.

Veress technology with visual color indicator

Diagram A

1. The color change indicator confirms “Safe-White” when the blunted obturator is extended over the sharp distal tip.

2. Prior to initial anatomical contact or when the distal tip of the device clears an anatomical obstruction or enters a free cavity, the spring-loaded obturator will automatically advance forward, providing protection against patient injury.

Diagram B

3. The color change indicator informs the user of anatomical contact by transitioning from “Safe-White” to “Caution-Red.”

4. The blunted obturator automatically retracts upon contact with an anatomical structure, exposing the sharp distal tip and allowing needle advancement.

Pigtail catheter

- Pigtail shape for secure placement and anatomically assisted self-direction
- Occlusion-resistant, with four ports strategically placed on inside apex of pigtail
- Silicone coated for smooth insertion and minimal potential for “accordion” effect

Self-sealing valve

- Closed system for minimized risk of pneumothorax or leakage
- The resealing membrane within the valve system allows the safety introducer needle assembly to be reinserted (for procedures not requiring maintenance of a closed system)
- Compatible with 0.035 and 0.038 guide wires to clear occlusions or expand your procedural capabilities beyond the percutaneous realm (for procedures not requiring maintenance of a closed system)
Ordering information
Safe-T-Centesis® catheter drainage system

Safe-T-Centesis® catheter drainage kit
Safe-T-Centesis kits provide a simplified format while maintaining important safety components to meet a variety of needs.

Kit components
- Vacuum extension set with needle
- Futura retractable safety scalpel
- Point-Lok needle retention safety device
