I. Sample preparation steps 1-5 are shared by all instrument configurations:

1. Gather materials and label with specimen ID
2. Remove cap from Reagent C tube
3. Add 300 µL of liquid sample
4. Close dispensing tube
5. Vortex

II. Before continuing to step 6, choose from the instrument and work flow configurations below:

A. Reader or Analyzer in Analyze Now mode

6. Add 3 drops of the processed sample to the device.
7. Time test development for 10 minutes.
8. Power on instrument with a single click and insert device to read when prompted.
9. Record result and remove device.

B. Analyzer in Walk Away mode

6. Click once to power on, wait for prompt then double-click to start WalkAway mode.
7. Add 3 drops of the processed sample to the device.
8. Insert device to start timing and analysis. Do not touch/keep level.
9. Record result and remove device - Analyzer returns to Analyze Now mode.

SPECIMEN COLLECTION AND HANDLING

Freshly collected specimens should be processed and tested immediately. If necessary, specimens may be stored at 2–8 ºC for up to 72 hours but specimens must be warmed to room temperature before testing. For washes/aspirates, sample volumes of 1 to 3 mL are recommended. For swab specimens in transport media, a minimal dilution of specimen is preferred and use of 1 mL or less of transport media is suggested for optimal test performance. It is essential that correct specimen collection and preparation methods be followed. Do not centrifuge specimens prior to use, as the removal of cellular material may adversely affect test sensitivity. Specimens obtained early in the course of the illness will contain the highest viral titers.

For in vitro Diagnostic use. Do NOT read test results visually. The BD Veritor System Instrument (purchased separately) must be used for interpretation of all test results. Refer to table at right.

2. Remove cap from Reagent C tube
3. Add 300 µL of liquid sample
4. Close dispensing tube
5. Vortex

II. Before continuing to step 6, choose from the work flow configurations below:

C. Analyzer in Analyze Now mode + InfoScan/Sync

6. Add 3 drops of the processed sample to the device.
7. Time test development for 10 minutes.
8. Power on with a single click and insert device to read when prompted.
9. Scan required bar codes to start analysis.
10. Record result and remove device.

D. Analyzer in Walk Away mode + InfoScan/Sync

6. Click once to power on, wait for prompt then double-click to start WalkAway mode.
7. Scan required bar codes.
8. Add 3 drops of the processed sample to the device.
9. Insert device to start timing and analysis. Do not touch/keep level.
10. Record result and remove device - Analyzer returns to Analyze Now mode.

For in vitro Diagnostic use. Do NOT read test results visually. The BD Veritor System Instrument (purchased separately) must be used for interpretation of all test results. Refer to table at right. Handle all specimens and materials as if capable of transmitting infectious agents. Dispose of used materials as biohazardous waste according to federal, state and local requirements. Ensure ALL components are at room temperature (15–30 °C) when running the test.
