Administration of IV push medications or flushes
Alaris® System pump module

1. Pause the pump module first to administer an IV push medication or an IV flush through an injection port on an Alaris® System administration set.

2. Occlude the tubing above the injection port closest to the patient to allow the medication or flush to flow toward the patient without backing up the tubing toward the pump.

3. Administer medication or flush.

4. Release the occluded tubing and select RESTART.
