

# BD Pseudomonas CFC Agar

## Prepared Plated Media

L012006(01)

2020-07

English

### INTENDED USE

BD Pseudomonas CFC Agar is used for the isolation of *Pseudomonas* species and related organisms (e.g., *Burkholderia cepacia*) from food, water, pharmaceutical materials and environmental samples.

BD does not assume responsibility if the product is used for applications, microorganisms, or procedures not recommended in the Instructions for Use.

### PRINCIPLES OF THE PROCEDURE

The base medium of Pseudomonas CFC Agar is a modification of King's A Medium in which magnesium chloride and potassium sulfate are present to enhance pigment production of fluorescent pseudomonads.<sup>1</sup> Pseudomonas CFC (Cetrimide Fusidin Cephaloridine) Supplement has been recommended for the selective isolation of *Pseudomonas* species generally. Mead and Adams showed that reducing the cetrimide content to 10 µg/mL allowed the growth of all pigmented and non-pigmented psychrophilic pseudomonads. To improve its selective action, they added cephaloridine and fusidin. This combination of agents gave a new and more specific medium for isolating pseudomonads from chilled foods and processing plants.<sup>2</sup>

Considerable interest is now being given to the detection of *Burkholderia cepacia* in water systems, particularly where the water is to be used for the preparation of pharmaceuticals or cosmetics.<sup>3</sup>

The peptones supply general nutrients such as amino acids. Potassium and magnesium ions enhance the pigment production of fluorescent pseudomonads. Cetrimide is a quaternary ammonium compound which, at the low concentration used in this medium, slightly suppresses the growth of non-pseudomonads. Together with cephaloridine and fusidin, it reduces the growth of the accompanying gram-positive and gram-negative bacteria.

### REAGENTS

#### Approximate Formulas\* Per Liter Purified Water

BD Pseudomonas CFC Agar	
Pancreatic Digest of Gelatin	16.0 g
Acid Hydrolysate of Casein	10.0 g
Potassium Sulfate	10.0 g
Magnesium Chloride	1.4 g
Cetrimide	0.01 g
Fucidin	0.01 g
Cephaloridine	0.05 g
Agar	11.0 g

pH 7.1 ± 0.2

\*Adjusted and/or supplemented as required to meet performance criteria.

### WARNINGS AND PRECAUTIONS

#### For laboratory use only.

Do not use plates if they show evidence of microbial contamination, discoloration, drying, cracking, or other signs of deterioration.

#### Biological and Chemical Safety of the Product

This section may also contain information on specific biological and/or chemical hazards, indicated by the appropriate symbols, together with the appropriate R (risk)- and S (safety)-phrases.<sup>4</sup>

#### Biohazard Originating from Specimens and Microorganisms Cultivated on Microbiological Media

Observe established precautions against microbiological hazards. Specimens and cultures of microorganisms must be handled according to local biohazard guidelines and legislation. According to the European Directive 2000/54/EC, most bacterial and fungal pathogens are included in risk group 2. Risk group 3 has been created to include *Salmonella* Typhi, enterohemorrhagic *Escherichia coli* (EHEC; also referred to as STEC = Shiga toxin-producing *E. coli*), *Shigella dysenteriae* (type 1) and several other bacteria and fungi. Other bacterial and fungal pathogens included in risk group 3 are: all *Brucella* spp.; *Mycobacterium tuberculosis*; *M. bovis*; *M. africanum*; *M. ulcerans*; and *Histoplasma capsulatum*. For details, consult Annex III of Directive 2000/54/EC.<sup>5</sup>

#### Product Disposal

After use and prior to discarding, specimen containers and all contaminated material, including the used culture media and contaminated culture containers, must be autoclaved for 20 to 30 min at 121 °C or higher (if large volumes of disposed materials must be sterilized), or incinerated by validated procedures.

#### STORAGE

On receipt, store plates in the dark at 2–8 °C, in their original sleeve wrapping until just prior to use. Avoid freezing and overheating. The plates may be inoculated up to the expiration date and incubated for the recommended incubation times.

## USER QUALITY CONTROL

Test samples of the medium with the strains mentioned below. Apply 10 to 100 cfu per plate from ATCC® 9027, and 100 to 1000 cfu per plate from ATCC 27853, ATCC 25416, and ATCC 19146. Use 10<sup>5</sup> cfu per plate from the remaining strains. Include Columbia Agar with 5% Sheep Blood or BD Trypticase™ Soy Agar plates as nonselective controls for all organisms. Incubate the plates, preferably in an inverted position, at 35–37 °C aerobically for 18 to 24 hours.

Species	Strains	Growth Results
<i>Pseudomonas aeruginosa</i>	ATCC 9027	Growth with greenish pigmentation
<i>Pseudomonas aeruginosa</i>	ATCC 27853	Growth with blue-green to yellow green pigmentation
<i>Burkholderia cepacia</i>	ATCC 25416	Growth, colorless to beige colonies
<i>Escherichia coli</i>	ATCC 25922	Inhibition complete
<i>Staphylococcus aureus</i>	ATCC 25923	Inhibition complete
Uninoculated		Colorless to light tan; clear

Always use fresh test strain suspensions, prepared from overnight cultures in appropriate liquid media (e.g., Tryptic or BD Trypticase™ Soy Broth for aerobes, and Schaedler Broth with hemin and vitamin K for anaerobes). Alternatively, fresh suspensions prepared from overnight cultures on plated media can be used. Incubation times of precultures must be extended if the test strain grows slowly. For **testing the nutritive capacity of a plated medium** according to the CLSI standard M22, dilute the inoculum suspension to provide 1 to 2 × 10<sup>4</sup> cfu per plate.<sup>6</sup> A tenfold lighter inoculum should be used if this does not provide isolated colonies. According to DIN EN 12322, the growth-promoting properties are tested with 100 to 1,000 cfu or a sufficient amount of cfu to provide isolated colonies by an appropriate streaking plate technique.<sup>7</sup> If the strains are inoculated by a quantitative plating technique, 50 to 500 cfu per plate are usually appropriate to obtain a countable number of colonies. For **testing the inhibitory capacity of a selective plated medium**, according to CLSI M22, 1 to 2 × 10<sup>5</sup> cfu per plate must be used for inoculation, and about 10<sup>4</sup> or more cfu according to DIN EN 12322.<sup>6,7</sup> Very high inocula of unwanted strains may "overload" the medium, leading to "breakthrough" growth. For comparison, always include a growth reference medium which should be a nonselective medium that provides optimal growth of all test strains. For aerobic strains, Columbia Agar with 5% Sheep Blood, for fastidious strains (like *Neisseria gonorrhoeae*) Chocolate Agar, for anaerobes Schaedler Agar with Vitamin K and 5% Sheep Blood, and for fungi Sabouraud Glucose Agar are suitable for this purpose. If tested quantitatively, growth of "desired" strains on the test medium should be at least 70% of that on the reference medium. On selective media, growth of "undesired" strains must be partially to completely inhibited. The degree of inhibition depends on the medium and the strains, but growth is usually reduced by a factor of 10<sup>3</sup> to 10<sup>4</sup> (or more) as compared to the growth on the nonselective growth reference medium. For **testing the growth performance of media in vials**, comparable methods are used. Smaller tubes and vials should be inoculated with 10<sup>5</sup> cfu according to the CLSI M22-A2 standard.<sup>6</sup> Vials or bottles with fill volumes above 10 mL should first be aliquoted in 5 or 10 mL amounts in sterile tubes and tested in the same way.

## PROCEDURE

### Materials Provided

BD Pseudomonas CFC Agar, provided in 90 mm BD Stacker™ plates.

### Materials Not Provided

Ancillary culture media, reagents, inoculating loops, spreaders, pipettors, incubators, and laboratory equipment as required.

### Test Procedure

Streak the samples as soon as possible after they are received in the laboratory. The streak plate is used primarily to isolate pure cultures from samples containing mixed flora. Special techniques may be necessary for processing liquid materials or foods etc. Other selective and nonselective media should be included to detect the whole spectrum of organisms present in the sample. Consult appropriate references. When frozen or refrigerated foods are tested with this medium, the plates should be incubated at room temperature. Otherwise incubate at 25–30 °C or at 35–37 °C. Plates should usually not be incubated longer than 48 hours because overgrowth of undesired organisms may result upon extended incubation.

### Results

After incubation most plates will show an area of confluent growth. Because the streaking procedure is, in effect, a "dilution" technique, diminishing numbers of microorganisms are deposited on the streaked areas. Consequently, one or more of these areas should exhibit isolated colonies of the organisms contained in the specimen. Further, growth of each organism may be semi-quantitatively scored on the basis of growth in each of the streaked areas. The development of a green to yellow green pigmentation is suggestive of *Pseudomonas aeruginosa*. Examination of the plates under long-wave UV light will allow the detection of fluorescent pseudomonads. Nonpigmented growth is suggestive of other pseudomonads.

Further tests are needed for a final identification of the isolated organisms.

## PERFORMANCE CHARACTERISTICS AND LIMITATIONS OF THE PROCEDURE

Certain *Pseudomonas*-like organisms, such as *Brevundimonas diminuta*, will be inhibited on this medium. There exist *Pseudomonas aeruginosa* strains that are unable to produce pigments.

Use of this medium with clinical specimens has not been validated.

## AVAILABILITY

Cat. No.	Description	Number of plates per package
212919	BD Pseudomonas CFC Agar	20
