

# BD MacConkey Agar without Salt

## Prepared Plated Media

L012081(01)

2020-06

English

### INTENDED USE

BD MacConkey Agar without Salt is a differential medium for the isolation of *Enterobacteriaceae*, staphylococci, and enterococci from clinical specimens such as urine.

BD does not assume any responsibility or liability if the product is used for or with any applications, microorganisms, or procedures not provided for or recommended in the Instructions for Use. The user assumes all such risk, responsibility and liability for any such unapproved use.

### PRINCIPLES OF THE PROCEDURE

Microbiological method.

Regular MacConkey Agar, such as BD MacConkey II Agar, is used for the selective isolation of *Enterobacteriaceae* and certain non-fermenters.<sup>1,2</sup> The inhibition of gram-positive bacteria is mainly due to the presence of crystal violet. In contrast to regular MacConkey Agar, BD MacConkey Agar without Salt does not inhibit gram-positive bacteria such as enterococci and staphylococci since it does not contain crystal violet.<sup>2</sup>

In BD MacConkey Agar without Salt, peptones provide nutrients. Bile salts act as mild inhibitors of non-intestinal bacteria and contribute to inhibit the swarming of *Proteus*. Lactose together with neutral red is the indicator system for lactose fermentation. On both media, either colorless to orange or pink colonies are produced depending on the ability of the isolate to ferment lactose. An improved inhibition of *Proteus* swarming is obtained due to the absence of salt. Therefore, this medium is especially recommended for quantitative bacteriological urine analysis.

### REAGENTS

#### Approximate Formulas\* Per Liter Purified Water

BD MacConkey Agar without Salt	
Peptones	20.0 g
Lactose	10.0 g
Bile Salts	5.0 g
Neutral Red	0.075 g
Agar	12.0 g

pH 7.4 ± 0.2

\*Adjusted and/or supplemented as required to meet performance criteria.

### WARNINGS AND PRECAUTIONS

For *in vitro* Diagnostic Use. Do not reuse. For trained laboratory personnel use only.

Do not use plates if they show evidence of microbial contamination, discoloration, drying, cracking, or other signs of deterioration.

### Biological and Chemical Safety of the Product

This section may also contain information on specific biological and/or chemical hazards, indicated by the appropriate symbols, together with the appropriate R (risk)- and S (safety)-phrases.<sup>11</sup>

### Biohazard Originating from Specimens and Microorganisms Cultivated on Microbiological Media

Observe established precautions against microbiological hazards. Specimens and cultures of microorganisms must be handled according to local biohazard guidelines and legislation. According to the European Directive 2000/54/EC, most bacterial and fungal pathogens are included in risk group 2. Risk group 3 has been created to include *Salmonella* Typhi, enterohemorrhagic *Escherichia coli* (EHEC; also referred to as STEC = Shiga toxin-producing *E. coli*), *Shigella dysenteriae* (type 1) and several other bacteria and fungi. Other bacterial and fungal pathogens included in risk group 3 are: all *Brucella* spp.; *Mycobacterium tuberculosis*; *M. bovis*; *M. africanum*; *M. ulcerans*; and *Histoplasma capsulatum*. For details, consult Annex III of Directive 2000/54/EC.<sup>12</sup>

### Product Disposal

After use and prior to discarding, specimen containers and all contaminated material, including the used culture media and contaminated culture containers, must be autoclaved for 20 to 30 min at 121 °C or higher (if large volumes of disposed materials must be sterilized), or incinerated by validated procedures.

EU Only: users should report any serious incident related to the device to the Manufacturer and National Competent Authority.

## STORAGE

On receipt, store plates in the dark at 2–8 °C, in their original sleeve wrapping until just prior to use. Avoid freezing and overheating. The plates may be inoculated up to the expiration date (see package label) and incubated for the recommended incubation times. Plates from opened stacks of 10 plates can be used for one week when stored in a clean area at 2–8 °C.

Avoid freezing and overheating. Freezing may result in complete deterioration of agar gels or in precipitations in liquid media. Temperatures exceeding the indicated storage temperature for a longer time may lead to deterioration of media ingredients. This holds especially true for selective agents, such as antimicrobials. Excessive moisture due to condensation water may develop after extreme subsequent temperature changes (e.g., from 2 to 25 °C and back to 2 °C) on all solid media. Plated media with excessive moisture must be dried before inoculation, e.g., by placing them with lids ajar into a clean incubator at 30–37 °C for not longer than one hour. Do not desiccate the media! The exact exposure time depends on the air humidity in the incubator. Contamination during storage must be avoided by the user, e.g., by packing the plates in **sterilized** plastic bags. All prepared media must be stored in the dark. If exposed to artificial light, sunlight, or UV light for a longer time, the performance of all media may be reduced. Several media, such as chromogenic media, Endo Agar, and others are especially sensitive to strong illumination before and during incubation. All BD prepared media may be used up to the expiration date and incubated for the recommended incubation times.

## USER QUALITY CONTROL

Incubate for 18 to 14 hours at 35–37 °C in an aerobic atmosphere. Do not incubate in a carbon dioxide-enriched atmosphere.

Species	Strains	Growth Results
<i>Escherichia coli</i>	ATCC® 25922	Colonies pink to red; may be surrounded by zones of bile precipitation, pink to red medium
<i>Proteus mirabilis</i>	ATCC 12453	Light brown colonies, swarming inhibited; yellow to orange medium
<i>Salmonella Typhimurium</i>	ATCC 14028	Light brown colonies, yellow to orange medium
<i>Shigella flexneri</i>	ATCC 12022	Light brown colonies, orange medium
<i>Enterococcus faecalis</i>	ATCC 29212	Small reddish colonies
<i>Staphylococcus aureus</i>	ATCC 25923	Small to medium rose colonies
Uninoculated		Reddish orange, slightly opalescent

## PROCEDURE

Always use fresh test strain suspensions, prepared from overnight cultures in appropriate liquid media (e.g., Tryptic or BD Trypticase™ Soy Broth for aerobes, and Schaedler Broth with hemin and vitamin K for anaerobes). Alternatively, fresh suspensions prepared from overnight cultures on plated media can be used. Incubation times of precultures must be extended if the test strain grows slowly. For **testing the nutritive capacity of a plated medium** according to the CLSI standard M22, dilute the inoculum suspension to provide 1 to 2 × 10<sup>4</sup> cfu per plate.<sup>13</sup> A tenfold lighter inoculum should be used if this does not provide isolated colonies. According to DIN EN 12322, the growth-promoting properties are tested with 100 to 1,000 cfu or a sufficient amount of cfu to provide isolated colonies by an appropriate streaking plate technique.<sup>14</sup> If the strains are inoculated by a quantitative plating technique, 50 to 500 cfu per plate are usually appropriate to obtain a countable number of colonies. For **testing the inhibitory capacity of a selective plated medium**, according to CLSI M22, 1 to 2 × 10<sup>5</sup> cfu per plate must be used for inoculation, and about 10<sup>4</sup> or more cfu according to DIN EN 12322.<sup>13,14</sup> Very high inocula of unwanted strains may "overload" the medium, leading to "breakthrough" growth. For comparison, always include a growth reference medium which should be a nonselective medium that provides optimal growth of all test strains. For aerobic strains, Columbia Agar with 5% Sheep Blood, for fastidious strains (like *Neisseria gonorrhoeae*) Chocolate Agar, for anaerobes Schaedler Agar with Vitamin K and 5% Sheep Blood, and for fungi Sabouraud Glucose Agar are suitable for this purpose. If tested quantitatively, growth of "desired" strains on the test medium should be at least 70% of that on the reference medium. On selective media, growth of "undesired" strains must be partially to completely inhibited. The degree of inhibition depends on the medium and the strains, but growth is usually reduced by a factor of 10<sup>3</sup> to 10<sup>4</sup> (or more) as compared to the growth on the nonselective growth reference medium. For **testing the growth performance of media in vials**, comparable methods are used. Smaller tubes and vials should be inoculated with 10<sup>5</sup> cfu according to the CLSI M22-A2 standard.<sup>13</sup> Vials or bottles with fill volumes above 10 mL should first be aliquoted in 5 or 10 mL amounts in sterile tubes and tested in the same way.

### Materials Provided

BD MacConkey Agar Without Salt, both provided in 90 mm BD Stacker™ plates. Microbiologically controlled.

### Materials Not Provided

Ancillary culture media, reagents, inoculating loops, spreaders, pipettors, incubators, and laboratory equipment as required.

### Specimen Types

BD MacConkey Agar Without Salt can be used for all types of clinical specimens. However, the main use is in urine analysis (see also **PERFORMANCE CHARACTERISTICS AND LIMITATIONS OF THE PROCEDURE**). Midstream or catheter urine, or urine collected by suprapubic bladder puncture can be used. Observe aseptic techniques for collecting urine specimens. Urine must be directly streaked on the medium not later than 2 hours after collection or must be kept refrigerated (not longer than 24 hours) to avoid overgrowth of the infectious agents or contaminants before inoculation of the medium.

### **Test Procedure**

Collect a sample of the undiluted, well-mixed urine using a calibrated loop (0.01 or 0.001 mL). Ensure proper loading of the loop. Inoculate the sample down the middle of the plate in a single streak from which additional spreading of the inoculum is performed.<sup>6-9</sup>

If specimens other than urine are cultivated on these media, streak for isolation. Alternatively, if material is being cultured directly from a swab, roll the swab over a small area of the surface at the edge; then streak for isolation from this inoculated area.

All specimens must also be cultivated on a blood agar plate, such as BD Columbia Agar with 5% Sheep Blood, to detect fastidious isolates that may not grow on BD MacConkey Agar Without Salt. Incubate the blood agar plate in an aerobic atmosphere enriched with CO<sub>2</sub>, and incubate the MacConkey Agar medium in ambient air at 35–37 °C for 24 to 48 hours.

### **Results**

After the incubation, lactose fermenters such as *E. coli* will appear rose or pink to red and may be surrounded by a turbid, rose precipitate of bile. Lactose nonfermenting organisms such as *Proteus* spp. will appear colorless. Lactose nonfermenters may change the color of the media to yellowish-beige while the reddish-orange coloration changes to pink upon growth of lactose fermenters. Staphylococci on both media and produce pale pink to rose colonies, and enterococci produce small red colonies. Additional biochemical tests are necessary for the final identification of the isolates.

### **PERFORMANCE CHARACTERISTICS AND LIMITATIONS OF THE PROCEDURE**

BD MacConkey Agar Without Salt is suitable for the isolation of many aerobically growing microorganisms, such as *Enterobacteriaceae*, *Pseudomonas*, and other nonfermenting gram-negative rods, enterococci, staphylococci, and many other organisms isolated from urine or other clinical specimens and nonclinical materials such as food.<sup>2-6</sup>

Streptococci and other organisms requiring blood or serum for growth may not grow or may only be insufficiently recovered on this medium. Therefore, the specimen should also be cultivated onto a blood agar or chocolate agar plate if such organisms are expected.

Genitourinary pathogens such as *Neisseria gonorrhoeae*, *Gardnerella vaginalis*, *Chlamydia*, *Ureaplasma*, or other fastidious organisms do not grow on this medium. Consult the references for the appropriate detection techniques of these organisms.<sup>7-9</sup>

Although a differentiation according to lactose fermentation and certain diagnostic tests may be performed directly on this medium, biochemical and, if indicated, immunological testing using pure cultures is necessary for complete identification.

Incubation of MacConkey Agar plates under increased CO<sub>2</sub> has been reported to reduce the growth and recovery of a number of strains of gram-negative bacilli.<sup>10</sup>

Further biochemical and/or serological tests are needed to identify the isolates obtained on these media.

### **AVAILABILITY**

<b>Cat. No.</b>	<b>Description</b>	<b>Number of plates per package</b>
256009	BD MacConkey Agar Without Salt	20
257286	BD MacConkey Agar Without Salt	120
