About the cover:

Computer colorization of, from top to bottom:

► Rat cerebellar granule (RCG) cells cultured on BD BioCoat™ PDL (page 6)
► Human umbilical vein endothelial cells (HUVECs) grown for seven days on BD BioCoat™ Gelatin 6-well Multiwell Plates (page 5)
► BHK-21 fibroblasts cultured on BD BioCoat™ Fibronectin CultureSlides (page 9)
► Neurotransmitter induced calcium waves in astrocytes plated on BD BioCoat™ Laminin/Fibronectin (page 13)
The development and normal functioning of cells depends on interactions with molecules in their micro-environment. The major classes of molecules that regulate cellular development and function include growth and differentiation factors, cell adhesion molecules and the components of the extracellular matrix (ECM). The ECM is composed of a number of different macromolecules whose structural integrity and functional composition are important in maintaining normal tissue architecture, in development and in tissue-specific function. The ECM exerts influences on behavior (adherence, spreading, differentiation and migration) and the pattern of gene expression of the cells in contact with it. The ECM, however, is not static but changes during both normal development and in tissue repair and regeneration and is intimately involved in both normal biological function and response to injury.¹

To create physiologically relevant in vitro models that support normal cell culture and function, the components of the in vivo environment must be incorporated. The use of an ECM as a coating for tissue culture surfaces permits the development of model systems which closely mimic in vivo conditions. The choice of ECM is an important component to consider when optimizing in vitro culture systems.

BD BioCoat™ Cellware

BD BioCoat™ Cellware is a unique line of tissue culture vessels with various ECM components applied to vessel surfaces by a proprietary manufacturing process. The result is a uniform, optically clear matrix substrate. This technology, together with our exacting quality control, guarantees the performance of each lot, as well as consistency from lot-to-lot.

BD BioCoat Cellware promotes cell attachment, spreading, growth and differentiation of a variety of primary cells and cell lines in serum-free or serum-containing cultures.

Applications include:
- Cell adhesion assays
- Receptor-ligand-binding assays
- Routine drug screening assays
- Studies of tissue morphogenesis
- Studies of cell-matrix interactions
- Regulation of signal transduction and gene expression

The first company to produce sterile, disposable labware, BD Biosciences is a world leader in providing researchers with top-quality cell culture products. BD Falcon™ Cultureware is treated using a unique vacuum gas plasma process resulting in a pure and consistent tissue culture surface. BD BioCoat™ Cellware is manufactured using BD Falcon products to ensure consistent, reliable results. Trust BD Biosciences, the first name in cell culture.

**BD BioCoat™...**

...**Flasks** are available in various sizes and designs to meet all of your cell culture needs in standard plug-seal and vented cap options.

...**Multiwell Plates** are manufactured using a crystal-grade polystyrene and feature a patented labyrinth lid, condensation rings and deep well design to control contamination while reducing evaporation and minimizing edge effects.

...**Dishes** are exceptionally flat for distortion-free optics and feature stacking rings for better stacking. Easy Grip design ensures save handling.

...**CultureSlides** have an innovative sealing design that minimizes leakage and a plastic chamber affixed to a specially cleaned glass slide that can be removed with an easy-to-use disposable safety removal tool.

...**Coverslips** are Number 1 German glass and provide an optically clear surface which is non-neurotoxic and exhibits low background fluorescence. The convenient package also acts as a storage container and allows for easy coverslip manipulation.

...**Coverslip-Bottom Dishes** are 35 mm style dishes with a coverslip bottom that is easy to use and facilitates preparation of cells for microscopic analysis. The coverslip floor is Number 1 German glass. This format is ideal for use in high resolution and inverted microscopy, fluorescence imaging in live cells, confocal microscopy, phase contrast microscopy and micro-manipulations.

For BD BioCoat™ Cell Culture Inserts and Assay Systems, please see our general BD Falcon™/BD BioCoat™ catalog.
BD Biosciences has a highly controlled manufacturing environment for BD BioCoat™ Collagen I, Gelatin and Poly-Lysine products in its ISO 9001 certified plant in Plymouth, England. ISO certification verifies that the facility meets international quality standards and that BD Biosciences provides assurance to customers that it is totally committed to delivering superior quality and product improvements.

The state-of-the-art cleanroom suite was designed and constructed to meet US, EU and British standards. All BD BioCoat products are produced under aseptic conditions to minimize the risk of product contamination from bacteria, fungi and particulates.

BD Biosciences also has a highly controlled environment for the BD BioCoat products manufactured in its ISO 9001 certified plant in Bedford, Massachusetts. The cleanroom suite, designed to meet US standards, ensures that all BD BioCoat products are produced under aseptic conditions.

Proprietary manufacturing technology, validated procedures and strict compliance with established protocols, combined with BD Biosciences exacting quality control, assure the biological performance of each lot, as well as consistency from lot-to-lot.

Proprietary formulation and manufacturing techniques allow BD Biosciences to produce room temperature Collagen I, Gelatin and Poly-Lysine Cellware. Extensive accelerated and real-time studies in the laboratory have confirmed product performance for at least one year under dry conditions at temperatures from 4° to 50°C.

BD BioCoat™ Collagen I Cellware

Collagen I, found in most tissues and organs, is most plentiful in dermis, tendon and bone. It is an integral part of the framework that holds cells and tissues together and has been recognized as a useful matrix for improving cell culture. In vitro use of collagen can exert effects on the adherence, morphology, growth, migration and differentiation of a variety of cell types.1

BD BioCoat™ Collagen I Cellware applications include:

► Promotion of cell attachment and spreading
► Rapid expansion of cell populations
► Serum-free or reduced serum culture
► Cell adhesion assays
► Improving survival of primary cells in culture

BD BioCoat™ Collagen I has been used to culture:

► Primary murine cardiac myocytes2
► Human vascular SMC3
► PC12 cells and SH-SY5Y cells4
► Mouse primary keratinocytes5
► SK-MEL-28-N1 cells6
► Murine myoblast C2C12 cells7
► HUVEC8
► HEK-293 cells9
► Rat Kupffer cells10
► MDA-231 breast cancer cells11

Effects of BD BioCoat™ Collagen I Cellware on Fetal Bovine Heart Endothelial (FBHE) Cells

FBHE cells grown for five days in basal medium containing 10% FBS on tissue-culture plastic show sparse growth.

FBHE cells grown for five days using the BD BioCoat Endothelial Cell Growth Environment (Collagen I Cellware) form a confluent monolayer and show numerous mitotic cells.

Source:
Rat tail tendon

Quality Control:
► Tested for ability to promote attachment and spreading of HT-1080 human fibrosarcoma cells
► Tested and found negative for bacteria and fungi
► Collagen I purity >90% by SDS-PAGE

Storage and Stability:
Cellware stable for at least six months from date of shipment when stored at 4° to 30°C under dry conditions. Coverslips and CultureSlides stable for at least three months from date of shipment when stored at 2° to 8°C.

BD BioCoat™ Gelatin Cellware provides an attachment and growth promoting substrate for the culture of a variety of cell types. Gelatin is used commonly in the culture of vascular endothelial cells, muscle, embryonic stem (ES) cells and F9 teratocarcinoma cells. It is also suitable for promoting adhesion of transfected cell types. Gelatin is a heterogeneous mixture of water-soluble proteins derived through the hydrolysis of Collagen.

BD BioCoat™ Gelatin Cellware applications include:

- Promotion of cell attachment and spreading of:
  - Vascular endothelial cells, i.e. BME1, BAEC2
  - Embryonic stem (ES) cells3
  - C2C12 myoblasts4 and MM14 myoblasts5
- Culture of normal and transfected F9 teratocarcinoma cells for gene expression studies6
- Culture of HUVEC for E-Selectin7 expression and VEGF induction8

Source:
Gelatin, porcine

Quality Control:
- Tested for ability to promote proliferation of HUVECs
- Tested and found negative for bacteria and fungi

Storage and Stability:
Stable for at least six months from date of shipment when stored at 4° to 30°C under dry conditions.

References
Poly-D-Lysine (PDL) and Poly-L-Lysine (PLL) are synthetic compounds that enhance cell adhesion and protein absorption by altering surface charges on the culture substrate. In addition to promoting cell adhesion, poly-lysine surface treatments support neurite outgrowth and improve the survival of many central nervous system (CNS) primary cells in culture. As PDL and PLL are synthetic molecules, they do not stimulate biological activity in the cells cultured on them, and they do not introduce impurities carried by natural polymers.

**BD BioCoat™ Poly-Lysine Cellware applications**

- Attachment and spreading of a variety of cell types
- Cell differentiation and neurite outgrowth
- Attachment of fastidious transfected cell lines
- Support survival of primary neurons in culture
- Serum-free or reduced serum culture

**BD BioCoat™ Poly-Lysine has been used to culture:**

- Primary mouse brain capillaries
- HEK-293 cells
- MDA-231 breast cancer cells
- Mouse cerebellar granule neurons
- Transfected rat 1 cells
- Rat anterior pituitary cells
- Transfected COS-7 cells
- Transiently transfected primary rat astrocytes
- Rat primary cerebellar granule neurons
- Murine microglia MG-7 cells

**Effect of BD BioCoat PDL on Cortical Neurons**

Mixed culture of cortical neurons and astrocytes cultured on BD BioCoat PDL Cellware. Neurons are highly branched with very long processes. Astrocytes show similar process elongation.

**Effect of BD BioCoat PDL on RCG Cells**

Rat cerebellar granule (RCG) cells cultured on BD BioCoat PDL show firm attachment (similar results obtained on PLL).

**Source:**

- PDL, synthetic (MW 75-150 kD)
- PLL, synthetic (MW 30-70 kD)

**Quality Control:**

- Tested for ability to promote firm attachment of RCG cells
- Tested and found negative for bacteria and fungi

**Storage and Stability:**

Cellware stable for at least six months from date of shipment when stored at 4° to 30°C under dry conditions. Coverslips and CultureSlides stable for at least three months from date of shipment when stored at 2° to 8°C.

References

Type IV Collagen is a ubiquitous component in basement membranes and provides the major structural support for this matrix. When the Collagen IV meshwork is assembled, it provides a scaffold for the assembly of other basement membrane components through interactions with laminin, entactin/nidogen and heparan sulfate proteoglycan. Collagen IV is useful as a substrate for growth of epithelial, endothelial, muscle and nerve cells. Collagen plays a role in the regulation of cell growth, differentiation and adhesion, as well as tissue formation.

**BD BioCoat™ Collagen IV Cellware applications include:**
- Promotion of cell attachment and spreading
- Cell differentiation and neurite outgrowth
- Increased proliferation of PC12 cells
- Studies of effects of Collagen IV on cell behavior
- Cell Adhesion Assays

**BD BioCoat™ Collagen IV Cellware has been used to culture:**
- PC12 cells
- SH-SY5Y cells
- Human melanoma cells lines SK-MEL-28-N1 and SK-MEL-28
- Primary murine hepatocytes

**Effects of BD BioCoat Collagen IV Cellware on PC12 Rat Pheochromocytoma Cells**

PC12 cells cultured on tissue-culture plastic do not attach well and tend to float in clumps in the culture medium.

PC12 cells cultured on BD BioCoat Collagen IV Cellware show 90% attachment and rapid proliferation.

BD BioCoat™ EHS Natrix Cellware

EHS Natrix is a natural ECM that is synthesized, secreted and formed in vitro by a continuous cell line established from primary tissue of the EHS tumor. The ECM secreted by these cells is similar to that which surrounds the in vivo EHS tumor. This in vitro ECM is composed of laminin, collagen IV and other components which have not as yet been fully characterized.¹

BD BioCoat™ EHS Natrix Cellware has been used to culture:
- Neural cell attachment and differentiation
- Transduction of neuroblastomas²
- Culture of fish hepatocytes
- Amniocyte attachment and culture
- Primary tumor-cell culture
- Dunning R-3327 rat prostatic adenocarcinoma cells³

Source:
Monolayers of a cell line established from the EHS mouse tumor

Quality Control:
- Tested for ability to promote differentiation (neurite outgrowth) of NG-108 rat glioma/mouse neuroblastoma cells
- Tested and found negative for bacteria and fungi

Storage and Stability:
Stable for at least three months at 2° to 8°C. Do not freeze.

References
Human Fibronectin (HFN) is a widely distributed glycoprotein that is used as a substrate to promote attachment of cells through its central-binding domain RGD sequence. HFN is a product of most mesenchymal and epithelial cells and is present in both the ECM and plasma. The principal function of HFN appears to be in cellular migration during wound healing and development, regulation of cell growth and differentiation and haemostasis/thrombosis.

**BD BioCoat™ Fibronectin Cellware** applications include:

- Promotion of cell attachment and spreading
- Rapid expansion of cell populations
- Serum-free or reduced serum culture
- Cell adhesion assays
- Studies of effects of HFN on cell behavior
- Improving survival of primary cells in culture

**BD BioCoat™ Fibronectin Cellware** has been used to culture:

- 3T3 Preadipocytes
- Transfected 293T and transfected H1299 cells
- MCF-10A cells
- Primary cord blood mononuclear cells
- SK-MEL-28 (human melanoma cells)
- NIH3T3 cells
- MDA-231 human breast cancer cells

**Source:**
Human plasma  NOTE: Source material tested for hepatitis B antigen and HIV-1 antibody

**Quality Control:**

- Tested for ability to promote attachment and spreading of BHK-21 hamster kidney cells
- Tested and found negative for bacteria and fungi
- Fibronectin purity > 90% by SDS-PAGE

**Storage and Stability:**
Stable for at least three months from date of shipment when stored at 2° to 8°C. Do not freeze.

**References**

Laminin (LM), a major component of basement membranes, is a multifunctional glycoprotein that is used as a substrate to culture and maintain differentiated function of a wide variety of cells. Laminin has been shown in culture to stimulate neurite outgrowth, promote cell attachment, chemotaxis, cell differentiation and neuronal survival.

**BD BioCoat™ Laminin Cellware applications include:**
- Promotion of cell attachment and spreading
- Induction of cell differentiation and neurite outgrowth
- Increases proliferation of myoblasts
- Studies of effects of laminin on cell behavior
- Cell adhesion assays

**BD BioCoat™ Laminin Cellware has been used to culture:**
- SH-SY5Y (human neuroblastoma), Neuro-2A (mouse neuroblastoma), N1-E115 (rat neuroblastoma)
- MCF-10A cells
- SK-MEL-28 cells
- HVSNC
- MDA-231 breast cancer cell line

**Effects of BD BioCoat Laminin Cellware on NG-108 Rat Glioma/Mouse Neuroblastoma Cells**

NG-108 rat glioma/mouse neuroblastoma cells cultured on tissue-culture plastic are loosely adhered and remain rounded.

NG-108 rat glioma/mouse neuroblastoma cells cultured on BD BioCoat Laminin Cellware exhibit a spindle-shaped morphology and dendritic processes.

Engelbreth-Holm-Swarm (EHS) mouse tumor

**Quality Control:**
- Tested for ability to initiate differentiation (neurite outgrowth) of NG-108 rat glioma/mouse neuroblastoma cells
- Tested and found negative for bacteria and fungi
- Laminin purity > 90% by SDS-PAGE (contains entactin)

**Storage and Stability:**
Stable for at least three months from date of shipment when stored at 2° to 8°C. Do not freeze.

References
BD Matrigel™ Basement Membrane Matrix is a solubilized basement membrane preparation extracted from the Engelbreth-Holm-Swarm (EHS) mouse sarcoma, a tumor rich in ECM proteins. Its major component is laminin, followed by collagen IV, heparan sulfate proteoglycans, entactin and nidogen. BD Matrigel Matrix is effective for the attachment and differentiation of both normal and transformed anchorage-dependent epithelial and other cell types including neurons and oligodendrocytes.

**BD BioCoat™ Matrigel™ Matrix Cellware applications include:**
- Elicitation of tissue-specific cellular morphology and protein production in epithelial cells
- Differentiation of endothelial, muscle and neuronal cells
- Development of three-dimensional matrix model systems

**BD BioCoat™ Matrigel™ Matrix has been used to culture:**
- Rat hepatocytes
- Primary human hepatocytes
- Mouse pituitary gland tissue
- Rabbit colonocytes
- Human urothelial cells
- Osteopontin (OPN) deficient rat vascular smooth muscle cells

**Source:**
EHS mouse tumor

**Formulation:**
Dulbecco’s Modified Eagles’ Medium with 50 µg/ml gentamycin. BD Matrigel Matrix is compatible with all culture media.

**Quality Control:**
- Tested for ability to promote neurite outgrowth from chick dorsal root ganglia in the absence of NGF
- Tested and found negative for bacteria and fungi

**Storage and Stability:**
- Cellware stable for at least three months at -20°C. Keep frozen until use.
- Thin layer cellware stable for at least three months from date of shipment when stored at 2° to 8°C.

BD BioCoat™ Osteologic™ Bone Cell Culture System

Historically, biologically derived hard tissues such as de-vitalized bone, dentine or ivory slices are used as culture substrates for in vitro assays. However, preparation and handling of these matrices is often expensive and time consuming. Ceramic biomaterial substrates are now being considered as an alternative to biologically derived substrates. BD BioCoat™ Osteologic™ Bone Cell Culture System consists of sub-micron synthetic calcium phosphate thin films coated onto various culture vessels. This system has been used as an alternative method for compound screening for direct assessment of osteoclast1-4 and osteoblast5 activity in vitro. The thin film design permits easy and reliable quantification of results.

BD BioCoat™ Osteologic™ MultiTest Slides

This unique multi-well test format is ideal for screening applications. Also designed for customers requiring multiple assays on a common substrate, and for parallel tests of resorption and bone growth in vitro.

► Proprietary bone biomaterial
► High test density — 16 discrete wells per quartz slide
► Allows parallel resorption and bone growth studies — minimizes variables
► Machine readable results using Microst™ Image Analyzer*
► Cost effective

BD BioCoat™ Osteologic™ Disks

This unique system incorporates a resorbable artificial bone analog in the form of sub-micron calcium phosphate films on transparent quartz substrates.

► Proprietary bone biomaterial
► Direct assessment of osteoclast and osteoblast activity in vitro
► Machine readable results using Microst™ Image Analyzer*
► Coverslip configurations also available for confocal microscopy, immunofluorescence and electrophysiology studies

* Please contact your local BD Biosciences representative for additional information.

For some applications, the use of a combination of ECM proteins, such as Laminin (LM) and Fibronectin (HFN) or LM and attachment factors such as Poly-D-Lysine (PDL) or Poly-L-Ornithine (PLO) has been shown superior to the use of either alone.

BD BioCoat™ PDL/LM and PLO/LM Cellware is suitable for culturing many different types of Peripheral Nervous System (PNS) and Central Nervous System (CNS) networks and is useful for promoting neural cell attachment and differentiation. BD BioCoat LM/HFN Cellware provides an in vitro environment that promotes cell attachment and extensive process formation.

BD BioCoat™ PDL/LM, PLO/LM and LM/HFN Cellware applications include:

- Enhancement of neuronal cell attachment to plastic and glass
- Promotion of neurite outgrowth
- Culture of glial cells as a feeder layer for neurons
- Construction of neural cell model systems to study CNS function, development and diseases

BD BioCoat™ PDL/LM has been used to culture:

- SH-SY5Y (human neuroblastoma), Neuro-2A (mouse neuroblastoma), N1-E115 (rat neuroblastoma)¹
- Primary rat hippocampus²
- Murine T11-L3 DRGNS³,⁴
- Transfected PC12 cells⁴
- MCF-10A cells⁵
- Rat primary dorsal root ganglion neurons⁶

Source:

- PDL, synthetic (MW 75-150 kD)
- PLO, synthetic (MW 30-70 kD)
- Laminin, EHS mouse tumor
- Fibronectin, human plasma

NOTE: Source material tested for hepatitis B antigen and HIV-1 antibody

Quality Control:

- PDL/LM and PLO/LM tested for ability to initiate differentiation (neurite outgrowth) of NG-108 rat glioma/mouse neuroblastoma cells
- Tested and found negative for bacteria and fungi

Storage and Stability:

Stable for at least three months at 2°C to 8°C. Do not freeze.

References

Plate-bound antibodies against the T-cell receptor complex have been used to induce activation of T-cells from a variety of species without the help of accessory cells. BD BioCoat™ T-Cell Activation Plates are precoated with high-quality BD Pharmingen CD3 antibodies. Available for use with mouse or human T-cells, BD BioCoat™ T-Cell Activation Plates offer lot-to-lot consistency and come individually packaged with lids for ease of use.

**BD BioCoat™ T-Cell Activation Plate applications include:**
- T-Cell activation
- Cytokine production
- Cytokine mRNA quantitation
- Co-stimulation
- Studies of drug effects on T-cell function

**Quality Control:**
- Tested for ability to proliferate mouse splenocytes or human PBMCs
- Tested and found negative for presence of bacteria and fungi

**Storage and Stability:**
Stable for at least three months at 2° to 8°C. Do not freeze.
BD BioCoat™ Variety Pack Cellware Products/
Vented Caps for BD BioCoat™ Flasks

BD BioCoat™ Variety Packs each contain 6-well Multiwell Plates or CultureSlides with a selection of different extracellular matrix proteins and attachment factors.

**BD BioCoat™ Variety Pack Cellware applications**
- Determination of optimal substrate for growth or differentiation of particular cell types
- Studies of effects of various ECM components on cell behavior
- Cell adhesion assays

**Quality Control:**
- Tested for ability to promote cell growth or differentiation (cell type used is indicated for each individual BD BioCoat Cellware product)
- Tested and found negative for bacteria and fungi

**Storage and Stability:**
Stable for at least three months at 2° to 8°C. Do not freeze.

**Vented Caps for BD BioCoat™ Flasks**
Vented caps are available for use with BD BioCoat™ Flasks. The vented caps are made from polyethylene and contain a 0.2 µm membrane vent that allows consistent gas exchange but prevents passage of bacteria and fungi. The special design reduces the risk of contamination associated with standard cell culture open incubation.

**Storage & Stability:**
Store at ambient temperature.

---

**pH equilibration using vented caps after flasks are placed in an incubator (175 cm² Flasks, 5% CO₂ incubator).**
BD BioCoat™ Collagen and PDL 96- and 384-well Plates for High Throughput Screening

Application Focus: Analysis of Transfected Cell Lines

BD BioCoat™ products coated with extracellular matrix proteins (ECM) and cell attachment factors are widely used to promote cell attachment, proliferation and differentiation. For high throughput screening during the drug discovery process, cell-based assays are used to identify drug candidates that exhibit a desired effect upon target function.

To provide an appropriate biological background, functional assays can be performed using transfected cell lines that express a wild-type or mutated gene of interest. Many transfected cell lines are susceptible to reduced adherence when 96- or 384-well assay plates are subjected to standard wash protocols during high throughput sample processing. Although vigorous washing is essential for reducing background noise, this treatment can result in sample loss due to disruption of the cell monolayer. Therefore, the acquisition of reliable data can be dramatically compromised when transfected cells exhibit weak attachment to the culture substrate. In contrast, transfected cell lines adhere strongly to assay plates that are coated with a cell attachment substrate.

A number of cell types are used for high throughput transfection analyses. The human embryonic kidney cell line HEK-293 is a common choice for stable transfections. Although these cells are useful for expressing a wide variety of transected genes, HEK-293 cells are especially susceptible to reduced adherence on standard assay plates during high throughput sample processing. However, strong adherence has been observed when transfected HEK-293 cells are cultured on BD BioCoat PDL, PLL or Collagen I Cellware. BD BioCoat Cellware is also effective for high throughput applications that utilize neuronal cell lines. For example, transfected human astrocytoma cells (1321N1) and PC12 cells have been cultured on BD BioCoat PDL and Collagen I, respectively. Also, a variety of BD BioCoat products are available that support neurite outgrowth and neurotransmitter receptor function.

High throughput studies of a variety of cell types (transfected and untransfected) have also been carried out using BD BioCoat HFN, Collagen IV and PDL/LM. Overall, BD BioCoat Cellware has been found to dramatically improve cell adherence during high throughput sample processing. In this regard, the appropriate culture substrate will contribute to the reliability of high throughput transfection analyses by providing optimal conditions for cell attachment and growth.

Applications:

- Reporter Gene Assays
- Ion Channel Activity
- Receptor Binding
- Cytotoxicity Assays
- Apoptosis Assays
- Cell Adhesion Kinetics
- Cell Proliferation Assays
- Calcium Flux Assays

BD Biosciences Discovery Labware offers a wide selection of microplates for cell-based fluorescence, luminescence, colorimetric and radiometric assays.

Specialized experimental conditions or the unique properties of a transfected cell line may result in poor adhesion to poly-D-lysine or other cell attachment substrates. In these cases, the BD BioCoat Custom Coating Service is dedicated to meeting your needs by developing specialized formulations of ECM proteins and/or cell attachment molecules.

Transfected HEK-293 cells exhibit poor adhesion to tissue culture-treated 96-well assay plates following multiple washes (top row). In contrast, these cells exhibit strong attachment to BD BioCoat PDL 96-well assay plates following vigorous washing (bottom row).
BD BioCoat™ Services

BD BioCoat™ Custom Coating Service
Custom Coating, the way YOU want it. BD BioCoat Custom Coating Service offers an extensive selection of cell-based coatings on a wide variety of BD Falcon™ vessels — from roller bottles to flasks to 384-well plates. We can even develop special coatings for you. Simply tell us the type of vessel and coating you would like applied and we’ll make a trial sample for you to evaluate.

BD BioCoat™ Consulting Service
BD Biosciences is committed to helping you optimize your cell culture conditions. The process of selecting the most appropriate substratum is often empirical and time consuming. Our consulting service can facilitate this process for you.

Our highly trained technical service staff will assist you in determining which BD BioCoat product is best for your cell type and application. Let BD Biosciences put its comprehensive technical database and expertise in cell culture to work for you.

BD BioCoat™ Bar Coding Service
Get on the road to increased productivity with BD BioCoat.
The BD Biosciences Discovery Labware Bar Coding Service provides high-quality bar code labels affixed to any side of a microplate. Bar codes have been quality tested for optimal readability, chemical resistance and temperature durability.
